Why use a Professional Irrigation Consultant?

Professional Irrigation Consultants are specialists. They know proven methods from their experiences and stay abreast of the rapid changes in technology. They are able to anticipate possible problems and can help avoid potential litigation on increasingly costly irrigation projects.

Water conservation concerns have emphasized the role of the Professional Irrigation Consultant, whose goal has always been efficiency in irrigation design. Consultants remain the best source for water audits, existing system analysis and corrective measures.

A competently designed plan with a set of bid and contract documents provided by a Professional Irrigation Consultant saves both short and long term costs on virtually any irrigation project. In the short term they provide a quality installation at minimum cost by eliminating doubts that often lead to contingency bidding. They also eliminate possible disagreements and misinterpretations that can create costly revisions, add-ons and change orders as the project progresses. In the long term the lower operating and maintenance costs, greater survival rate and better condition of plant material, plus increased water conservation over the life of the system are important factors in the success of the project.

Professional Irrigation Consultants perform impartially in the best interest of the Client since they have no proprietary interest in the products they specify. Because their income is derived solely from professional fees, Professional Irrigation Consultants have no conflicts of interest when designing and specifying an irrigation project.

There are literally thousands of irrigation products currently on the market. Only someone completely familiar with that market is in a position to make intelligent choices for the project. The Client must be protected from purchasing sub-standard materials that will not perform over the long haul as well as expensive materials that may be too sophisticated for the project and be a waste of money. The Professional Irrigation Consultant can guide the Client through this confusing and sometimes contradictory market place.

When time and money have been committed to the design and installation of an irrigation project, it is prudent to invest sufficient funds to provide field observations by the design Consultant. This can prevent loss of control over the project during installation. The Consultant knows the intent and purpose of the documents and can best represent the Owner to assure an efficient and trouble free irrigation system.

Professional Members of the American Society of Irrigation Consultants are qualified Irrigation Consultants. They are screened for experience and education before being granted Professional Member status. You are assured of competence when you use the services of a Professional Member of ASIC.

The preparation of irrigation system plans and specifications, the observation of system construction, and recommendations for irrigation management are best performed through the services of

Bluegrass Irrigation Consulting Ltd.

We are happy to answer your questions and work together with you to meet your irrigation goals.
